REGINA

CHARACTERISTICS

The K2 Regina is a stable and comfortable kayak that adapts exceptionally well to veteran athletes or with few river kilometers .

Of pointing out, that it although continues to be a very covered kayak for doing certain competitions, like marathons for example.

The hull geometry checks good balance properties even in situations where the wind and or the tides create adverse conditions for the canoeing practice.

The kayak offers a very interesting commitment between effort application, balance maintenance and sliding. The fact of checking excellent stability allows that the athlete executes each paddle very freely with technique and robustness and that all the athlete's performance will be converted in movement.

Enable to go down some rivers or to slide smoothly in calm waters.

The kayak presents the following dimensions:

Length 6500 mm | Width 550 mm | Height 250 mm | Weight: 18,250 kg (F.V. /Sp)

PRODUCTION

We produce in glass fiber, glass/Spheretex fiber, Kevlar or Vectran.

With option of platform seats or simply screw.
